Product Description

DUC01 and PUC01 are precise TRMS AC/DC over+under, over+over or under+under voltage (selectable by DIP-switch) monitoring relays. The voltage levels are adjustable separately and have their own time delay.
Owing to the built-in latch function, the ON-position of the relay output can be maintained. Inhibit function can be used to avoid relay operation when not desired (maintenance, transitions).
The LED's indicate the state of the alarm and the output relay.

Mode of Operation

DUC01 and PUC01 monitor both AC and DC over+under, over+over or under+under voltage.

Example 1
(no contact input - under+over voltage - 2 x SPDT relays (1 x SPDT for PUC01))

DUC01: One relay operates when the voltage drops below the under voltage set point for more than the respective delay time. It releases when the voltage exceeds the set level plus the set hysteresis. The other relay operates when the voltage exceeds the over voltage set point for more than the respective delay time. It releases when the voltage drops below the set level minus hysteresis (the hysteresis is the same for both set levels).

PUC01: The relay operates when the voltage drops below the under voltage set level for more than the respective set delay time or when it exceeds the over voltage set level for more than the respective set delay time. The relay releases when the voltage exceeds the under voltage set level plus hysteresis and it drops below the over voltage set level minus hysteresis (the hysteresis is the same for both set levels).

Example 2
(latch enabled active - under+ under voltage - 2 x SPDT relays (1 x SPDT for PUC01))

DUC01: Each relay operates and latches when the voltage drops below the respective set level for more than the respective delay time. Provided that the voltage has exceeded the respective set level (see hysteresis), each relay releases when the contact input's connection is interrupted.

PUC01: The relay operates when the voltage drops below the higher set level for more than the respective delay time. Provided that the voltage has exceeded the respective set level plus hysteresis, the relay releases when the contact input is opened.

Example 3
(inhibit enable active - over+ over voltage - DPDT relay (1 x SPDT for PUC01))

Provided that the contact input is opened, the relay operates when the voltage exceeds the lower set level for more than the respective delay time. It releases when the voltage drops below the lower set level (see hysteresis) or when the contact input's pins are connected.

Note:
When the inhibit contact is opened, if the input signal is already in alarm position, the delay time needs to elapse before relay(s) activation.
